

MEDDIC App

An AI-powered sales intelligence product that turns qualification methodology, market signals and outreach preparation into one operational workflow.

Sales methodology

AI product design

Workflow automation

Built to demonstrate how a complex B2B sales process can become a usable AI product: structured, explainable and ready for daily work.

Sales teams lose leverage when qualification, signals and action plans live in separate tools.

The process challenge

MEDDIC is rigorous, but hard to apply consistently when account context, news, contacts and next steps are scattered.

The product response

MEDDIC App centralizes qualification, evidence, prioritization, Discovery preparation, outreach and monitoring.

The portfolio signal

The project proves product thinking across sales methodology, AI orchestration, UX, backend reliability and local-to-production discipline.

1

Understand the method

Translate MEDDIC into product primitives: dimensions, score, evidence, gaps.

2

Design the workflow

Connect prospecting, qualification, signals, next action and follow-up.

3

Operationalize AI

Use workflows and guardrails so LLM output becomes usable sales context.

The app is a sales operating system, not a standalone scorecard.

Operating loop

The product connects account targeting, qualification, signal ranking and activation in one repeatable workflow instead of isolated tools.

AI boundary

Automation supports the seller with evidence, prioritization and drafts; the human still validates context, judgement and action.

What the architecture proves

1

Method translated into data

MEDDIC becomes dimensions, evidence, risk, versioning and next actions.

2

Signals turned into decisions

News, LinkedIn context and jobs are ranked before they reach the seller.

The dashboard makes qualification health visible at portfolio level.

It turns individual analyses into management signals: average score, pipeline status, MEDDIC profile, conversion funnel and at-risk deals.

Process insight

A sales methodology becomes useful when it can be aggregated and reviewed across the pipeline.

Product decision

The dashboard prioritizes scanability over decoration: filters, KPIs, risk and recent accounts first.

The core screen translates MEDDIC into evidence, gaps and next action.

Method depth

Six MEDDIC dimensions are scored separately, preserving the difference between qualification quality and overall lead priority.

Explainability

The score is paired with rationale, evidence, warnings, contact context and a recommended next best action.

Operational UX

The same report opens into news, monitoring, Discovery preparation, outreach, notes, sharing and PDF export.

AI workflows convert public signals into sales evidence.

The app gathers and structures news, LinkedIn context, job postings and weak signals, then ranks what matters commercially.

N8N orchestration

LLM logic lives in N8N workflows, with backend job tracking, callback handling and static workflow validation.

Signal Hub

Signals are scored by ICP fit, product fit, urgency, freshness, confidence and risk before they feed Discovery or Outreach.

The screenshot displays the MEDDIC Analyzer web application interface. The top navigation bar includes links for Dashboard, Analyser (active), Prospection, Pipeline, Monitoring, Corbeille, Admin, and Actions en cours (1). The main content area is titled 'RAPPORT MEDDIC' and features a profile for 'Oréal' (Cosmétiques) with contact information for Julien Truchaud. A large score of 70.6 is prominently displayed, along with a status of 'Élevé' and a warning 'URGENCE : ÉLEVÉ'. Below the report, there are buttons for 'Nouvelle analyse', 'Mettre à jour', 'Modifier la fiche', 'Exporter en PDF', 'Partager', 'Vue radar', and 'Notes'. The interface also shows a section for 'KT BEST ACTION' with a button to 'Préparer Discovery'. At the bottom, there is a 'VEILLE & ACTUALITÉS' section for 'Oréal' with a 'Rafraîchir' button and a 'ANALYSE IA' section.

The product does not stop at analysis; it prepares the commercial move.

Discovery Prep

A readable call brief turns the analysis into objectives, timing, evidence, hypotheses, ordered questions and a fallback ask.

Smart Outreach

The same signal selection can generate a personalized email draft grounded in ranked signals, persona context and allowed claims.

Product choice

Activation screens reuse the MEDDIC report context instead of asking the seller to rebuild the case in a separate tool.

The screenshot displays the MEDDIC App interface. At the top, a 'RAPPORT MEDDIC' card for 'L'Oréal' (Cosmétiques) is shown, with contact information for Julien Truchaud and a 'Mendo' button. A score of 70.6/100 is displayed, along with a 'Urgence : Élevé' status. Below this, a 'NEXT BEST ACTION' section suggests structuring the discovery around a priority signal. The main section, 'Préparer un Discovery Call', includes a command brief, a contact selection dropdown (Julien Truchaud), and buttons for 'Contact prêt', 'MEDDIC disponible', and '27 signaux de veille'.

Prospecting extends the app upstream before a MEDDIC analysis exists.

Prospecting Inbox

Target accounts are scored by fit, signal strength and confidence before human validation.

Conversion path

Qualified targets can be converted into MEDDIC analyses, keeping early-stage prospecting connected to structured qualification.

Monitoring implemented

A separate monitoring surface tracks targets and events over time without mixing discovery radar with MEDDIC score history.

PROSPECTION INBOX

Prospection

Sessions indépendantes de comptes cibles priorisés par fit ICP, signal utile et confiance, avant conversion volontaire vers MEDDIC.

Verdict
Compte à prioriser si le secteur, la taille et le signal détecté correspondent au brief de session. La conversion MEDDIC reste soumise à validation des champs.

Preuves et hypothèses

PREUVE
PayFit présente un signal product_launch exploitable pour une prospection compte.

HYPOTHÈSE
Le contexte public suggère une douleur potentielle autour de "Performance regressions found too late No reliable pre-production"

A portfolio project at the intersection of sales process, AI product and software delivery.

Core message: I can turn a complex commercial methodology into an AI product that is structured, explainable and usable in daily sales execution.

Sales process expertise

MEDDIC is translated into evidence, risk, gaps and concrete next actions sellers can execute.

AI product management

LLM outputs are scoped, normalized, versioned and governed through clear workflow boundaries.

B2B product design

The UX follows sales work: account context, qualification, signal triage, call prep and outreach.

Engineering execution

React, Node, PostgreSQL, Docker, job tracking, health checks, API-cost visibility and deployment discipline.
